Directional control valve RS 210

Solutions that power your visions
Make use of the Nordhydraulic expertise

Our skilled and experienced design and application engineers are at your disposal, helping you to specify the valve configuration that meets your application requirements.

Key valve features

RS 210 is a sectional valve, designed for system pressures up to 350 bar and pump flows up to 70 l/min.

It is available with 1 to 10 working sections per valve assembly.

The valve can be used in different systems for parallel as well as tandem circuits. It is designed with an open centre for fixed and variable displacement pumps.

The valve can be operated manually, with cable or by pneumatic and electro-pneumatic remote control.

The valve offers excellent operating characteristics because of the specially designed spools for different applications.

Low and uniform spool forces are the result of careful balancing of the flow forces.

Q-function

The flow control (Q-function) of the inlet section bypasses the major part of the pump flow to tank when the system is idling, thereby greatly reducing heat generation. But it also gives access to the full pump flow when the services are operated and provide improved operating characteristics.

Applications

The RS 210 is ideal for applications where you need excellent control characteristics such as cranes, excavators, back-hoe-loaders, skid loaders and tipping gear.

Further RS 210 properties and possibilities

• Several different in- and outlet alternatives offering possibility for electrical unloading, connecting and dimensional flexibility.

• Very wide programme of different spools optimised for various pump flows, applications, system alternatives etc.

• Spool controls for external kick-out and spool position sensing.

• Load checks in each working section.

• High pressure carry-over.

• Left hand and right hand side inlet.

Data sheet

This data sheet presents a selection of standard components and how to specify these in a valve assembly according to your application requirements. For further information on RS 210 and available components, please contact Nordhydraulic.

**Technical data - weight - dimensions**

### Pressures / flow
Max. system pressure* ........................................... 350 bar (35.0 MPa)
Max continuous return line pressure .......... 20 bar (2.0 MPa)
Rated pump flow ..................................................... 50 l/min
With Q-inlet ......................................................... 70 l/min
*depending on configuration and application

### Further data
- Spring force for spool control 910 in neutral position: 110 N (11.0 kp).
- Spring force for spool control 901 with fully selected spool: 135 N (13.5 kp).
- Recommended contamination level at normal duty: equal to or better than 18/14 as per ISO 4406.

- Hydraulic fluid viscosity range at continuous operation: 10-400 mm²/s (cSt). Higher viscosity allowed at start up.
- Mineral oil and synthetic oil based on mineral oil are recommended.
- Max. hydraulic fluid temperature range for continuous operation: -15°C - +80°C.
- Spool leakage at 100 bar, 32 cSt and 40°C: < 13 cm³/min.

Inlet and outlet type A - side connection

**I01A** has two pump ports and one tank port.

With the main relief valve fitted in the A-side cavity, the A-port is the pump port and the B-port is the tank port. If the main relief valve is fitted in the B-side cavity the opposite is valid for the pump and tank ports.

With this configuration the max system pressure can be 300 bar.

For information regarding the outlet - see outlet sections.

Inlet and outlet section type B - top connection

106B has one pump port and one tank port, both facing upwards. The main relief cavity is on the B-side.

With this configuration the max system pressure can be 300 bar.

Note: Inlet of type B offers a connection between the tank galleries of A and B sides.

For information regarding the outlet - see outlet sections.

Pressure drop, P1 - T4, inlet i02C, outlet U01B

Pressure drop, P1 - T1/T3, inlet I02C, outlet U01B
Inlet type E - with electrical unloading

101E has one pump port and one tank port, both facing upwards. The main relief cavity is facing upwards. Main relief options: TBD160 up to 300 bar and TBS400 up to 350 bar.

The cavity for the electrical unloading valve is facing upwards. The A- and B-side tank channels are connected.

2. El. unloading valve ......................................................... E912
3. Main relief valve ............................................................. TB12
4. Flow control .......................................................... FKA283/2
5. Flow control .......................................................... FKA283/3
6. Metering orifice, diam 5,4 mm .................................... PF11
7. Metering orifice, diam 5,7 mm .................................... PF12

I02Q is an inlet section with flow control, main relief valve and unloading function.

When the system is idling a small regulated flow passes the centre gallery of the valve. Excess pump flow is routed directly to tank.

The regulated flow is defined by the flow control valve FKA283 and the metering orifice PF.

When a spool is operated the whole pump flow is instantly available for the user. The low center gallery flow during idling conditions reduce pressure drop P-T through the valve body, and this facilitates higher pump flow without negative influence on the spool forces and heat generation.

I02Q also is equipped with main relief valve TB12, which together with flow control FKA283, function as a pilot operated main relief valve. Q-inlet can be equipped with a solenoid operated valve for electrical unloading.

The available metering orifices are PF11 and PF12. In combination with FKA283 they provide:

PF11 ................................................................. 25 l/min
PF12 ................................................................. 28 l/min

A lower flow creates less pressure drop P - T.

A spool that matches the flow improves the operating characteristics.

Pressure drop, P1 -T4, inlet I02Q/I06Q, with flow control FKA283/2 and PF12, outlet U01B
Inlet type I06Q - with by-pass and electrical unloading

I06Q has the same functions as I02Q but with an added special check valve FSB3 in the signal gallery to damp the unloading function of the flow control valve FKA. I06Q also provides an additional pump port.

Pressure drop P1 - T4, inlet I02Q/I06Q, unloaded

Intermediate sections

**M01A** is an intermediate inlet section used in dual circuit systems. The A-port is for pump connection and the B-port is for tank connections. The main relief valve cavity is on the A-side. The second circuit pump is connected to port A. If the first circuit pump flow is connected to the inlet section and spool sections upstream of M01A is not used, both pump flows are available for use downstream of M01A. The tank gallery is common for all sections.

![Diagram of M01A](image)

1. Intermediate section ................................................... M01A
2. Main relief valve ........................................................ TBD131

**M01B** is an intermediate inlet section used for two completely separated circuits. The A-port is for pump connection and the B-port is for tank connections. The main relief valve cavity is on the A-side. The tank gallery is common for all sections.

![Diagram of M01B](image)

1. Intermediate section ................................................... M01B
2. Main relief valve ........................................................ TBD131

Outlet sections

**U01A** has two tank ports, T2 on the top and T1 on the side. For series connection a high pressure carry-over nipple should be fitted in T1. In this case an alternative tank port always has to be connected to the tank.

![Diagram of U01A](image)

1. Outlet section ............................................................. U01A
2. High pressure carry over nipple .................................... SG21

**U01B** has two tank ports, both facing upwards. For series connection a high pressure carry-over plug PS20 should be fitted in location S1 in port T1. In this case an alternative tank port always has to be connected to the tank.

![Diagram of U01B](image)

1. Outlet section ............................................................. U01B
2. Plug (S1) ................................................................. PS20

**U01C** is an end plate without porting.

![Diagram of U01C](image)

1. Outlet section ............................................................. U01C

**U01A**

High pressure carry-over nipple SG21 is fitted in port T1.

**U01B**

High pressure carry-over plug PS20 is fitted through port T1 in location S1. T1 is now port for series connection.
**Electrical unloading valve**

The electrical unloading valve is a 2-way, normally open, solenoid type cartridge valve. It is an option in inlet sections I02Q, I06Q and I01E.

It is intended for emergency stop and for pressure drop/heat generation reduction.

In Q-inlets a de-energised unloading valve drains the pilot circuit so that the FKA283 spool dumps the whole pump flow directly to tank.

In inlet I01E a de-energised unloading valve dumps the whole pump flow to tank.

**Data**

- Rated flow: 40 l/min
- Power consumption: 17 W
- Rated voltage: 12 or 26 V
- Max voltage variation: +/- 10%
- Duty factor*: 100%
- Connection: Hirschmann ISO 4400 DIN 43650
- Protection class: IP65

* Sufficient cooling must be secured

The unloading valve has manual override.

E912 and E926 has push and twist type pin operation.
This pin is sealable.
PE20 is the plug for the cavity.

**Codes**

- E912..........push and twist type override 12 V
- E926..........push and twist type override 26 V
Main relief valves

Main relief valve TBS400

TBS400 is a pilot operated relief valve for the primary circuit. It is adjustable and sealable.

It is optional in inlet section I01E.

Setting range: 35 - 350 bar (3,5 - 35,0 MPa).

Setting range step: 5 bar.

Main relief function with TB12

The flow control valve FKA283, in combination with the relief valve TB12, form the pilot operated main relief function of the Q-inlets. TB12 is adjustable and sealable.

Setting range: 35 - 350 bar (3,5 - 35,0 MPa).

Setting range step: 5 bar.
Main relief valves

Main relief valve TBD131

TBD131 is a differential area, direct acting relief valve for the primary circuit. It is adjustable and sealable.

TBD131 is used in inlet sections I01A, I06B, I02C and intermediate sections M01A and M01B.

Setting range: 35 - 300 bar (3.5 - 30.0 MPa).
Setting range step: 5 bar.

Main relief valve TBD160

TBD160 is a differential area, direct acting relief valve for the primary circuit. It is adjustable and sealable.

TBD160 is optional in inlet I01E.

Setting range: 35 - 300 bar (3.5 - 30.0 MPa).
Setting range step: 5 bar.
# Spools

The RM 230 spools are available in a variety of flows and styles to accommodate most design requirements. Since the development of spools is a continuous process and all available spools are not described in this data sheet, contact Nordhydraulic for advice on choosing spools in order to optimize your valve configuration.

Service port valves

Port relief valve TBD121
TBD121 is a differential area, direct acting relief valve for the secondary circuit. It is adjustable and sealable.
Setting range: 35 - 300 bar (0.5 - 30.0 MPa).
Setting range step: 5 bar.

Port relief and anticavitation valve TBD121
See TBD121 and SB160 for functional principles
Setting range: 35 - 300 bar (0.5 - 30.0 MPa).
Setting range step: 5 bar.

Anticavitation valve SB160
The anticavitation valve service to ensure that, in the event of a lower pressure in the cylinder port than in the tank, oil can be drawn from the system oil tank to the consumer.

Anticavitation characteristics TBD121 and SB160
Pressure drop characteristics TBD/TBSD121
Typical hydraulic circuit diagram

Hydraulic circuit diagram for a four sectional RS 210 valve. It is fitted with a Q-inlet with electrical unloading. The first three sections contain 3-positions spools for double acting functions and port relief and anticavitation valves. The fourth section contains a 4-position spool for double acting functions with float position in position 4. The outlet gives possibility for high pressure carry-over (if S1 is plugged).
